Why is linear algebra useful in computer vision?

- **Representation**
 - 3D points in the scene
 - 2D points in the image
- **Coordinates will be used to**
 - Perform geometrical transformations
 - Associate 3D with 2D points
- **Images are matrices of numbers**
 - Find properties of these numbers

Agenda

1. How did you like the movie? 😊
2. Basics definitions and properties
3. Geometrical transformations
4. Application: removing perspective distortion

Vectors (i.e., 2D or 3D vectors)

Image

Vectors (i.e., 2D vectors)

$$\mathbf{v} = (x_1, x_2)$$

Magnitude: $\|\mathbf{v}\| = \sqrt{x_1^2 + x_2^2}$

If $\|\mathbf{v}\| = 1$, \mathbf{v} is a UNIT vector

$$\frac{\mathbf{v}}{\|\mathbf{v}\|} = \left(\frac{x_1}{\|\mathbf{v}\|}, \frac{x_2}{\|\mathbf{v}\|} \right) \text{ is a unit vector}$$

Orientation: $\theta = \tan^{-1}\left(\frac{x_2}{x_1}\right)$

Vector Addition

$$\mathbf{v} + \mathbf{w} = (x_1, x_2) + (y_1, y_2) = (x_1 + y_1, x_2 + y_2)$$

Vector Subtraction

$$\mathbf{v} - \mathbf{w} = (x_1, x_2) - (y_1, y_2) = (x_1 - y_1, x_2 - y_2)$$

Scalar Product

$$a\mathbf{v} = a(x_1, x_2) = (ax_1, ax_2)$$

Inner (dot) Product

$$v \cdot w = (x_1, x_2) \cdot (y_1, y_2) = x_1 y_1 + x_2 y_2$$

The inner product is a **SCALAR!**

$$v \cdot w = (x_1, x_2) \cdot (y_1, y_2) = \|v\| \cdot \|w\| \cos \alpha$$

$$\text{if } v \perp w, \quad v \cdot w = ? = 0$$

Orthonormal Basis

$$\mathbf{i} = (1,0) \quad \|\mathbf{i}\| = 1$$

$$\mathbf{j} = (0,1) \quad \|\mathbf{j}\| = 1$$

$$\mathbf{i} \cdot \mathbf{j} = 0$$

$$\mathbf{v} = (x_1, x_2)$$

$$\mathbf{v} = x_1 \mathbf{i} + x_2 \mathbf{j}$$

$$\mathbf{v} \cdot \mathbf{i} = ? = (x_1 \mathbf{i} + x_2 \mathbf{j}) \cdot \mathbf{i} = x_1 \cdot 1 + x_2 \cdot 0 = x_1$$

$$\mathbf{v} \cdot \mathbf{j} = (x_1 \mathbf{i} + x_2 \mathbf{j}) \cdot \mathbf{j} = x_1 \cdot 0 + x_2 \cdot 1 = x_2$$

Vector (cross) Product

$$u = v \times w$$

The cross product is a **VECTOR!**

Magnitude: $\| u \| = \| v \cdot w \| = \| v \| \| w \| \sin \alpha$

Orientation:

$$u \perp v \Rightarrow u \cdot v = (v \times w) \cdot v = 0$$

$$u \perp w \Rightarrow u \cdot w = (v \times w) \cdot w = 0$$

if $v \parallel w$? $\rightarrow u = 0$

Vector Product Computation

$$\mathbf{i} = (1,0,0)$$

$$\|\mathbf{i}\| = 1$$

$$\mathbf{j} = (0,1,0)$$

$$\|\mathbf{j}\| = 1$$

$$\mathbf{i} \cdot \mathbf{j} = 0 \quad \mathbf{i} \cdot \mathbf{k} = 0 \quad \mathbf{j} \cdot \mathbf{k} = 0$$

$$\mathbf{k} = (0,0,1)$$

$$\|\mathbf{k}\| = 1$$

$$\mathbf{u} = \mathbf{v} \times \mathbf{w} = (x_1, x_2, x_3) \times (y_1, y_2, y_3)$$

$$= (x_2 y_3 - x_3 y_2) \mathbf{i} + (x_3 y_1 - x_1 y_3) \mathbf{j} + (x_1 y_2 - x_2 y_1) \mathbf{k}$$

Matrices

$$A_{n \times m} = \begin{bmatrix} a_{11} & a_{12} & \cdots & a_{1m} \\ a_{21} & a_{22} & \cdots & a_{2m} \\ a_{31} & a_{32} & \cdots & a_{3m} \\ \vdots & \vdots & \ddots & \vdots \\ a_{n1} & a_{n2} & \cdots & a_{nm} \end{bmatrix}$$

Pixel's intensity value

$$\text{Sum: } C_{n \times m} = A_{n \times m} + B_{n \times m} \quad c_{ij} = a_{ij} + b_{ij}$$

A and B must have the same dimensions!

$$\text{Example: } \begin{bmatrix} 2 & 5 \\ 3 & 1 \end{bmatrix} + \begin{bmatrix} 6 & 2 \\ 1 & 5 \end{bmatrix} = \begin{bmatrix} 8 & 7 \\ 4 & 6 \end{bmatrix}$$

Matrices

$$A_{n \times m} = \begin{bmatrix} a_{11} & a_{12} & \cdots & a_{1m} \\ a_{21} & a_{22} & \cdots & a_{2m} \\ a_{31} & a_{32} & \cdots & a_{3m} \\ \vdots & \vdots & \ddots & \vdots \\ a_{n1} & a_{n2} & \cdots & a_{nm} \end{bmatrix} \quad \mathbf{a}_i$$

$$B_{n \times m} = \begin{bmatrix} b_{11} & b_{12} & \cdots & b_{1m} \\ b_{21} & b_{22} & \cdots & b_{2m} \\ b_{31} & b_{32} & \cdots & b_{3m} \\ \vdots & \vdots & \ddots & \vdots \\ b_{n1} & b_{n2} & \cdots & b_{nm} \end{bmatrix} \quad \mathbf{b}_j$$

Product:

$$C_{n \times p} = A_{n \times m} B_{m \times p}$$

$$c_{ij} = \mathbf{a}_i \cdot \mathbf{b}_j = \sum_{k=1}^m a_{ik} b_{kj}$$

A and B must have compatible dimensions!

$$A_{n \times n} B_{n \times n} \neq B_{n \times n} A_{n \times n}$$

Matrices

Transpose:

$$C_{m \times n} = A^T_{n \times m}$$

$$(A + B)^T = A^T + B^T$$

$$c_{ij} = a_{ji}$$

$$(AB)^T = B^T A^T$$

If $A^T = A$

A is symmetric

Examples:

$$\begin{bmatrix} 6 & 2 \\ 1 & 5 \end{bmatrix}^T = \begin{bmatrix} 6 & 1 \\ 2 & 5 \end{bmatrix}$$

$$\begin{bmatrix} 6 & 2 \\ 1 & 5 \\ 3 & 8 \end{bmatrix}^T = \begin{bmatrix} 6 & 1 & 3 \\ 2 & 5 & 8 \end{bmatrix}$$

$$\begin{bmatrix} 5 & 2 \\ 1 & 5 \end{bmatrix}$$

Symmetric? **No!**

$$\begin{bmatrix} 3 & 2 \\ 2 & 7 \end{bmatrix}$$

Symmetric? **Yes!**

Matrices

Determinant:

$$\det \begin{bmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{bmatrix} = \begin{vmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{vmatrix} = a_{11}a_{22} - a_{21}a_{12}$$

$$\det \begin{bmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{bmatrix} = a_{11} \begin{vmatrix} a_{22} & a_{23} \\ a_{32} & a_{33} \end{vmatrix} - a_{12} \begin{vmatrix} a_{21} & a_{23} \\ a_{31} & a_{33} \end{vmatrix} + a_{13} \begin{vmatrix} a_{21} & a_{22} \\ a_{31} & a_{32} \end{vmatrix}$$

A must be square

Example: $\det \begin{bmatrix} 2 & 5 \\ 3 & 1 \end{bmatrix} = 2 - 15 = -13$

Matrices

Inverse:

A must be square

$$A_{n \times n} A^{-1}_{n \times n} = A^{-1}_{n \times n} A_{n \times n} = I$$

$$\begin{bmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{bmatrix}^{-1} = \frac{1}{a_{11}a_{22} - a_{21}a_{12}} \begin{bmatrix} a_{22} & -a_{12} \\ -a_{21} & a_{11} \end{bmatrix}$$

Example:

$$\begin{bmatrix} 6 & 2 \\ 1 & 5 \end{bmatrix}^{-1} = ? = \frac{1}{28} \begin{bmatrix} 5 & -2 \\ -1 & 6 \end{bmatrix}$$

$$\begin{bmatrix} 6 & 2 \\ 1 & 5 \end{bmatrix}^{-1} \begin{bmatrix} 6 & 2 \\ 1 & 5 \end{bmatrix} = \frac{1}{28} \begin{bmatrix} 5 & -2 \\ -1 & 6 \end{bmatrix} \begin{bmatrix} 6 & 2 \\ 1 & 5 \end{bmatrix} = \frac{1}{28} \begin{bmatrix} 28 & 0 \\ 0 & 28 \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$$

2D Geometrical Transformations

2D Translation

2D Translation Equation

$$\mathbf{P} = (x, y)$$

$$\mathbf{t} = (t_x, t_y)$$

$$\mathbf{P}' = \mathbf{P} + \mathbf{t} = (x + t_x, y + t_y)$$

2D Translation using Matrices

$$\mathbf{P} = (x, y)$$

$$\mathbf{t} = (t_x, t_y)$$

$$\mathbf{P}' \rightarrow \begin{bmatrix} x + t_x \\ y + t_y \end{bmatrix} = \begin{bmatrix} 1 & 0 & t_x \\ 0 & 1 & t_y \end{bmatrix} \cdot \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$$

Homogeneous Coordinates

- Multiply the coordinates by a non-zero scalar and add an extra coordinate equal to that scalar. For example,

$$(x, y) \rightarrow (x \cdot z, y \cdot z, z) \quad z \neq 0$$

$$(x, y, z) \rightarrow (x \cdot w, y \cdot w, z \cdot w, w) \quad w \neq 0$$

Back to Cartesian Coordinates:

- Divide by the last coordinate and eliminate it. For example,

$$(x, y, z) \quad z \neq 0 \rightarrow (x/z, y/z)$$

$$(x, y, z, w) \quad w \neq 0 \rightarrow (x/w, y/w, z/w)$$

- NOTE: in our example the scalar was 1

2D Translation using Homogeneous Coordinates

$$\mathbf{P} = (x, y) \rightarrow (x, y, 1)$$

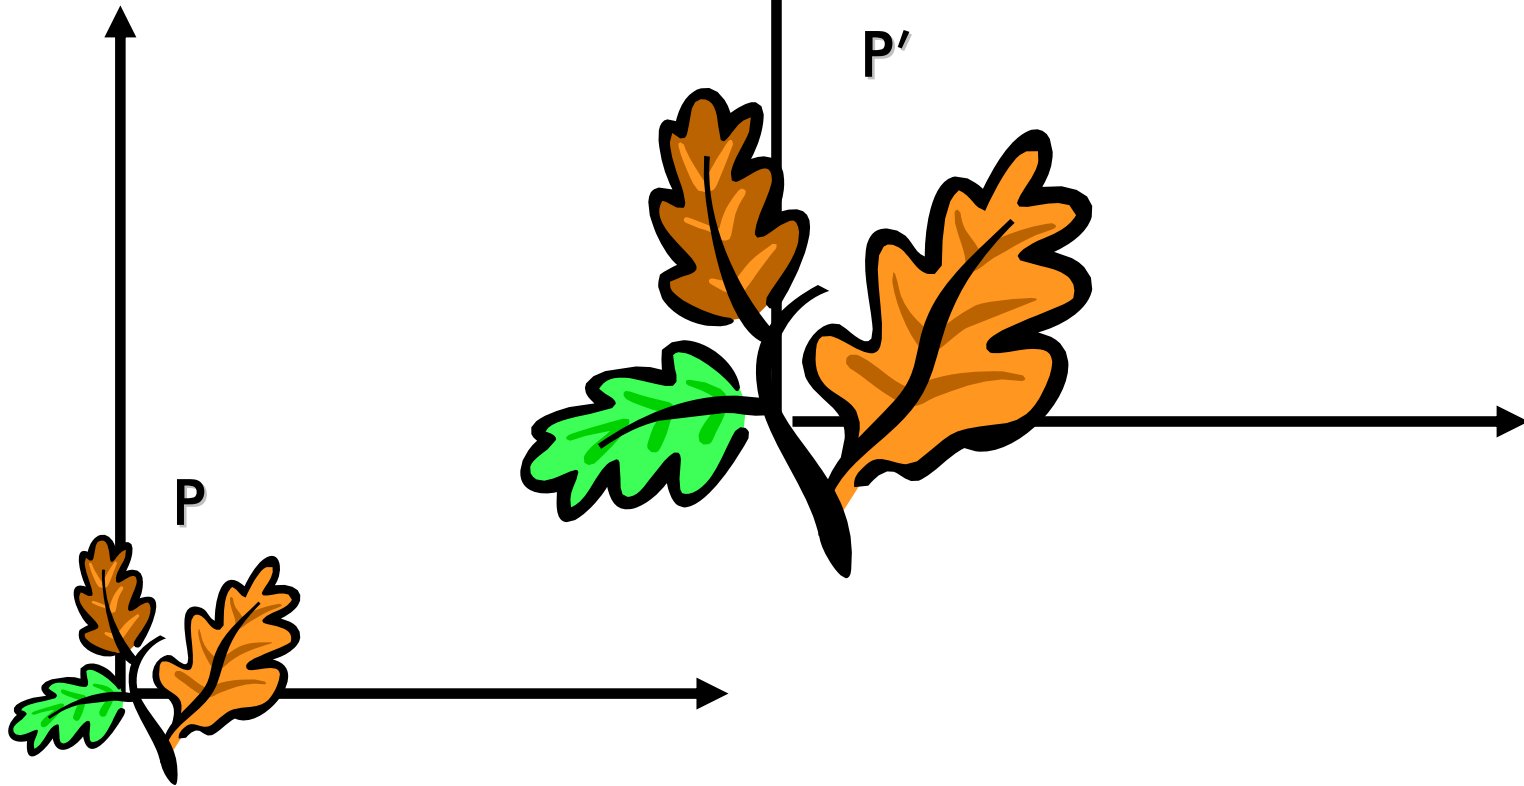

$$\mathbf{t} = (t_x, t_y) \rightarrow (t_x, t_y, 1)$$

$$\mathbf{P}' \rightarrow \begin{bmatrix} x + t_x \\ y + t_y \\ 1 \end{bmatrix} = \begin{bmatrix} 1 & 0 & t_x \\ 0 & 1 & t_y \\ 0 & 0 & 1 \end{bmatrix} \cdot \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$$

\swarrow **t**
 \swarrow **P**

$$= \begin{bmatrix} \mathbf{I} & \mathbf{t} \\ 0 & 1 \end{bmatrix} \cdot \mathbf{P} = \mathbf{T} \cdot \mathbf{P}$$

Scaling

Scaling Equation

$$\mathbf{P} = (x, y) \rightarrow \mathbf{P}' = (s_x x, s_y y)$$

$$\mathbf{P} = (x, y) \rightarrow (x, y, 1)$$

$$\mathbf{P}' = (s_x x, s_y y) \rightarrow (s_x x, s_y y, 1)$$

$$\mathbf{P}' \rightarrow \begin{bmatrix} s_x x \\ s_y y \\ 1 \end{bmatrix} = \underbrace{\begin{bmatrix} s_x & 0 & 0 \\ 0 & s_y & 0 \\ 0 & 0 & 1 \end{bmatrix}}_{\mathbf{S}} \cdot \begin{bmatrix} x \\ y \\ 1 \end{bmatrix} = \begin{bmatrix} \mathbf{S}' & \mathbf{0} \\ \mathbf{0} & \mathbf{1} \end{bmatrix} \cdot \mathbf{P} = \mathbf{S} \cdot \mathbf{P}$$

Scaling & Translating

$$P' = S \cdot P$$

$$P'' = T \cdot P'$$

$$P'' = T \cdot P' = T \cdot (S \cdot P) = (T \cdot S) \cdot P = A \cdot P$$

Scaling & Translating

$$\begin{aligned} \mathbf{P}'' = \mathbf{T} \cdot \mathbf{S} \cdot \mathbf{P} &= \begin{bmatrix} 1 & 0 & t_x \\ 0 & 1 & t_y \\ 0 & 0 & 1 \end{bmatrix} \cdot \begin{bmatrix} s_x & 0 & 0 \\ 0 & s_y & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix} = \\ &= \underbrace{\begin{bmatrix} s_x & 0 & t_x \\ 0 & s_y & t_y \\ 0 & 0 & 1 \end{bmatrix}}_{\mathbf{A}} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix} = \begin{bmatrix} S & t \\ 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix} = \begin{bmatrix} s_x x + t_x \\ s_y y + t_y \\ 1 \end{bmatrix} \end{aligned}$$

Translating & Scaling = Scaling & Translating ?

$$\mathbf{P}''' = \mathbf{T} \cdot \mathbf{S} \cdot \mathbf{P} = \begin{bmatrix} 1 & 0 & t_x \\ 0 & 1 & t_y \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} s_x & 0 & 0 \\ 0 & s_y & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix} = \begin{bmatrix} s_x & 0 & t_x \\ 0 & s_y & t_y \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix} = \begin{bmatrix} s_x x + t_x \\ s_y y + t_y \\ 1 \end{bmatrix}$$

$$\mathbf{P}''' = \mathbf{S} \cdot \mathbf{T} \cdot \mathbf{P} = \begin{bmatrix} s_x & 0 & 0 \\ 0 & s_y & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} 1 & 0 & t_x \\ 0 & 1 & t_y \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix} =$$

$$= \begin{bmatrix} s_x & 0 & s_x t_x \\ 0 & s_y & s_y t_y \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix} = \begin{bmatrix} s_x x + s_x t_x \\ s_y y + s_y t_y \\ 1 \end{bmatrix}$$

Rotation

Rotation Equations

Counter-clockwise rotation by an angle θ

$$x' = \cos \theta x - \sin \theta y$$

$$y' = \cos \theta y + \sin \theta x$$

$$\begin{bmatrix} x' \\ y' \end{bmatrix} = \begin{bmatrix} \cos \theta & -\sin \theta \\ \sin \theta & \cos \theta \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix}$$

$$\mathbf{P}' = \mathbf{R} \mathbf{P}$$

Degrees of Freedom

$$\begin{bmatrix} x' \\ y' \end{bmatrix} = \begin{bmatrix} \cos \theta & -\sin \theta \\ \sin \theta & \cos \theta \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix}$$

R is 2x2  **4 elements**

Note: **R** belongs to the category of *normal* matrices and satisfies many interesting properties:

$$\mathbf{R} \cdot \mathbf{R}^T = \mathbf{R}^T \cdot \mathbf{R} = \mathbf{I}$$

$$\det(\mathbf{R}) = 1$$

Rotation + Scaling + Translation

$$\mathbf{P}' = (\mathbf{T} \mathbf{R} \mathbf{S}) \mathbf{P}$$

$$\mathbf{P}' = \mathbf{T} \cdot \mathbf{R} \cdot \mathbf{S} \cdot \mathbf{P} = \begin{bmatrix} 1 & 0 & t_x \\ 0 & 1 & t_y \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} \cos \theta & -\sin \theta & 0 \\ \sin \theta & \cos \theta & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} s_x & 0 & 0 \\ 0 & s_y & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix} =$$

$$= \begin{bmatrix} \cos \theta & -\sin \theta & t_x \\ \sin \theta & \cos \theta & t_y \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} s_x & 0 & 0 \\ 0 & s_y & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix} =$$

$$= \begin{bmatrix} \mathbf{R}' & \mathbf{t} \\ 0 & 1 \end{bmatrix} \begin{bmatrix} \mathbf{S} & 0 \\ 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix} = \boxed{\begin{bmatrix} \mathbf{R}' \mathbf{S} & \mathbf{t} \\ 0 & 1 \end{bmatrix}} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$$

If $s_x = s_y$, this is a similarity transformation!

Transformation in 2D

-Isometries

-Similarities

-Affinity

Transformation in 2D

Isometries:

[Euclidean]

$$\begin{bmatrix} x' \\ y' \\ 1 \end{bmatrix} = \begin{bmatrix} R & t \\ 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix} = H_e \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$$

- Preserve distance (areas)
- 3 DOF
- Regulate motion of rigid object

Transformation in 2D

Similarities:

$$\begin{bmatrix} x' \\ y' \\ 1 \end{bmatrix} = \begin{bmatrix} s & R & t \\ & & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix} = H_s \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$$

- Preserve
 - ratio of lengths
 - angles
- 4 DOF

Transformation in 2D

Affinities:
$$\begin{bmatrix} x' \\ y' \\ 1 \end{bmatrix} = \begin{bmatrix} A & t \\ 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix} = H_a \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$$

$$A = \begin{bmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{bmatrix} = R(\theta) \cdot R(-\phi) \cdot D \cdot R(\phi) \quad D = \begin{bmatrix} s_x & 0 \\ 0 & s_y \end{bmatrix}$$

Transformation in 2D

Affinities:

$$\begin{bmatrix} x' \\ y' \\ 1 \end{bmatrix} = \begin{bmatrix} A & t \\ 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix} = H_a \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$$

$$A = \begin{bmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{bmatrix} = R(\theta) \cdot R(-\phi) \cdot D \cdot R(\phi) \quad D = \begin{bmatrix} s_x & 0 \\ 0 & s_y \end{bmatrix}$$

-Preserve:

- Parallel lines
- Ratio of areas
- Ratio of lengths on collinear lines
- others...

- 6 DOF

Transformation in 2D

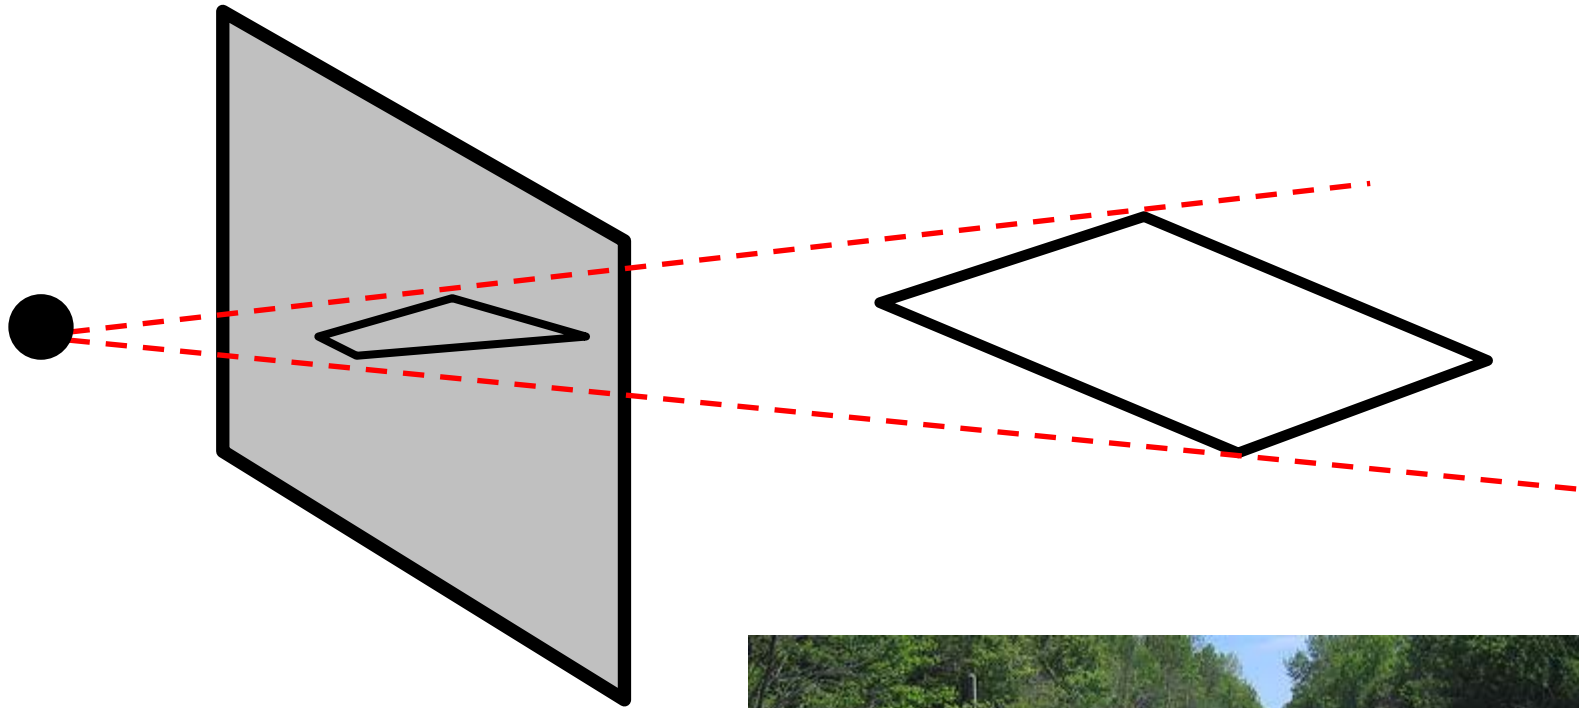

Projective:

$$\begin{bmatrix} x' \\ y' \\ 1 \end{bmatrix} = \begin{bmatrix} A & t \\ v & b \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix} = H_p \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$$

- 8 DOF
- Preserve:
 - cross ratio of 4 collinear points
 - collinearity
 - and a few others...

Transformation in 2D

Removing perspective distortion

(rectification)

Computing H_p

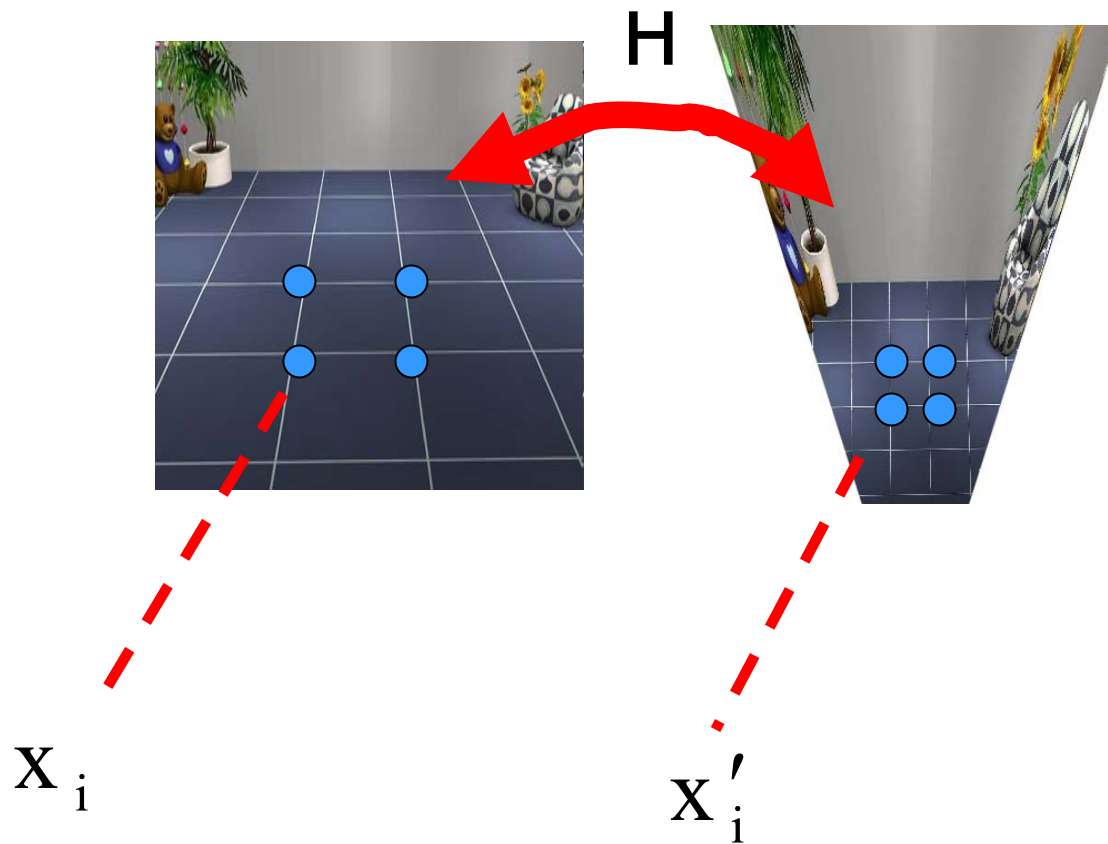

- 8 DOF
- how many points do I need to estimate H_p ?

At least 4 points! (8 equations)

- There are several algorithms...

DLT algorithm (Direct Linear Transformation)

$$x'_i = H x_i$$

DLT algorithm (direct Linear Transformation)

$$\mathbf{x}'_i \times \mathbf{H} \mathbf{x}_i = 0 \quad \longrightarrow \quad \underbrace{\mathbf{A}_i}_{\text{Function of measurements}} \overbrace{\mathbf{h}}^{\text{unknown}} = 0$$

$$\mathbf{h} = \underbrace{\begin{pmatrix} h^1 \\ h^2 \\ h^3 \end{pmatrix}}_{9 \times 1}, \quad \mathbf{H} = \begin{matrix} & & (\mathbf{h}^1)^T \\ \begin{bmatrix} h_1 & h_2 & h_3 \\ h_4 & h_5 & h_6 \\ h_7 & h_8 & h_9 \end{bmatrix} \end{matrix}$$

**Homogenous
system!**

DLT algorithm (direct Linear Transformation)

How to solve $A_i h = 0$?

Singular Value Decomposition (SVD)!

Eigenvalues and Eigenvectors

- Eigen relation

$$\mathbf{A}\mathbf{u}=\lambda\mathbf{u}$$

- Matrix \mathbf{A} acts on vector \mathbf{u} and produces a scaled version of the vector.
- Eigen is a German word meaning “proper” or “specific”
- \mathbf{u} is the eigenvector while λ is the eigenvalue.

Eigenvalues and Eigenvectors

The eigenvalues of A are the roots of the *characteristic equation*

$$p(\lambda) = \det(\lambda I - A) = 0$$

$$S^{-1}AS = \Lambda = \begin{bmatrix} \lambda_1 & & & \\ & \lambda_2 & & \\ & & \cdot & \\ & & & \lambda_N \end{bmatrix} \text{ diagonal form of matrix}$$

Eigenvectors of A are columns of S

Singular Value decomposition

- **Singular values:** Non negative square roots of the eigenvalues of $\mathbf{A}^t\mathbf{A}$. Denoted $\sigma_i, i=1, \dots, n$
- **SVD:** If \mathbf{A} is a real m by n matrix then there exist orthogonal matrices \mathbf{U} ($\in \mathbb{R}^{m \times m}$) and \mathbf{V} ($\in \mathbb{R}^{n \times n}$) such that

$$\mathbf{U}^{-1}\mathbf{A}\mathbf{V} = \Sigma = \begin{bmatrix} \sigma_1 & & & \\ & \sigma_2 & & \\ & & \cdot & \\ & & & \sigma_N \end{bmatrix}$$

Properties of the SVD

- Suppose we know the singular values of \mathbf{A} and we know r are non zero

$$\sigma_1 \geq \sigma_2 \geq \dots \geq \sigma_r \geq \sigma_{r+1} = \dots = \sigma_p = 0$$

- Rank(\mathbf{A}) = r .
- Null(\mathbf{A}) = span $\{\mathbf{v}_{r+1}, \dots, \mathbf{v}_n\}$
- Range(\mathbf{A}) = span $\{\mathbf{u}_1, \dots, \mathbf{u}_r\}$
- $\|\mathbf{A}\|_F^2 = \sigma_1^2 + \sigma_2^2 + \dots + \sigma_p^2$ $\|\mathbf{A}\|_2 = \sigma_1$
- *Numerical rank*: If k singular values of A are larger than a given number ε . Then the ε rank of A is k .
- Distance of a matrix of rank n from being a matrix of rank $k = \sigma_{k+1}$

Why is it useful?

- Square matrix may be singular due to round-off errors.
Can compute a “regularized” solution

–
$$\mathbf{x} = \mathbf{A}^{-1} \mathbf{b} = (\mathbf{U} \Sigma \mathbf{V}^t)^{-1} \mathbf{b} = \sum_{i=1}^n \frac{\mathbf{u}_i^t \mathbf{b}}{\sigma_i} \mathbf{v}_i$$

- If σ_i is small (vanishes) the solution “blows up”
- Given a tolerance ε we can determine a solution that is “closest” to the solution of the original equation, but that does not “blow up”
$$\mathbf{x}_r = \sum_{i=1}^k \frac{\mathbf{u}_i^t \mathbf{b}}{\sigma_i} \mathbf{v}_i \quad \sigma_k > \varepsilon, \quad \sigma_{k+1} \leq \varepsilon$$

- Least squares solution is the \mathbf{x} that satisfies

$$\mathbf{A}^t \mathbf{A} \mathbf{x} = \mathbf{A}^t \mathbf{b}$$

- can be effectively solved using SVD

DLT algorithm (direct Linear Transformation)

How to solve $A_i h = 0$?

A_i is 2×9 and h is 9×1 .

$$\begin{cases} A_1 h = 0 \\ A_2 h = 0 \\ \vdots \\ A_N h = 0 \end{cases} \rightarrow A_{2N \times 9} h_{9 \times 1} = 0$$
$$\downarrow$$
$$U_{2n \times 9} D_{9 \times 9} V^T_{9 \times 9}$$

Last column of V gives $h!$ $\rightarrow H!$

DLT algorithm (direct Linear Transformation)

From:

Multiple View Geometry in Computer Vision,

by R. Hartley and A. Zisserman, Academic Press, 2002

4.1 The Direct Linear Transformation (DLT) algorithm

We begin with a simple linear algorithm for determining H given a set of four 2D to 2D point correspondences, $\mathbf{x}_i \leftrightarrow \mathbf{x}'_i$. The transformation is given by the equation $\mathbf{x}'_i = H\mathbf{x}_i$. Note that this is an equation involving homogeneous vectors; thus the 3-vectors \mathbf{x}'_i and $H\mathbf{x}_i$ are not equal, they have the same direction but may differ in magnitude by a non-zero scale factor. The equation may be expressed in terms of the vector cross product as $\mathbf{x}'_i \times H\mathbf{x}_i = \mathbf{0}$. This form will enable a simple linear solution for H to be derived.

If the j -th row of the matrix H is denoted by $\mathbf{h}^{j\top}$, then we may write

$$H\mathbf{x}_i = \begin{pmatrix} \mathbf{h}^{1\top}\mathbf{x}_i \\ \mathbf{h}^{2\top}\mathbf{x}_i \\ \mathbf{h}^{3\top}\mathbf{x}_i \end{pmatrix}.$$

Writing $\mathbf{x}'_i = (x'_i, y'_i, w'_i)^\top$, the cross product may then be given explicitly as

$$\mathbf{x}'_i \times H\mathbf{x}_i = \begin{pmatrix} y'_i\mathbf{h}^{3\top}\mathbf{x}_i - w'_i\mathbf{h}^{2\top}\mathbf{x}_i \\ w'_i\mathbf{h}^{1\top}\mathbf{x}_i - x'_i\mathbf{h}^{3\top}\mathbf{x}_i \\ x'_i\mathbf{h}^{2\top}\mathbf{x}_i - y'_i\mathbf{h}^{1\top}\mathbf{x}_i \end{pmatrix}.$$

Since $\mathbf{h}^{j\top}\mathbf{x}_i = \mathbf{x}'_i{}^\top\mathbf{h}^j$ for $j = 1, \dots, 3$, this gives a set of three equations in the entries of H , which may be written in the form

$$\begin{bmatrix} \mathbf{0}^\top & -w'_i\mathbf{x}'_i{}^\top & y'_i\mathbf{x}'_i{}^\top \\ w'_i\mathbf{x}'_i{}^\top & \mathbf{0}^\top & -x'_i\mathbf{x}'_i{}^\top \\ -y'_i\mathbf{x}'_i{}^\top & x'_i\mathbf{x}'_i{}^\top & \mathbf{0}^\top \end{bmatrix} \begin{pmatrix} \mathbf{h}^1 \\ \mathbf{h}^2 \\ \mathbf{h}^3 \end{pmatrix} = \mathbf{0}. \quad (4.1)$$

These equations have the form $A_i\mathbf{h} = \mathbf{0}$, where A_i is a 3×9 matrix, and \mathbf{h} is a 9-vector made up of the entries of the matrix H ,

$$\mathbf{h} = \begin{pmatrix} \mathbf{h}^1 \\ \mathbf{h}^2 \\ \mathbf{h}^3 \end{pmatrix}, \quad H = \begin{bmatrix} h_1 & h_2 & h_3 \\ h_4 & h_5 & h_6 \\ h_7 & h_8 & h_9 \end{bmatrix} \quad (4.2)$$

with h_i the i -th element of \mathbf{h} . The three columns regarding these equations are in order here.

- (i) The equation $A_i \mathbf{h} = \mathbf{0}$ is an equation *linear* in the unknown \mathbf{h} . The matrix elements of A_i are quadratic in the known coordinates of the points.
- (ii) Although there are three equations in (4.1), only two of them are linearly independent (since the third row is obtained, up to scale, from the sum of x'_i times the first row and y'_i times the second). Thus each point correspondence gives two equations in the entries of H . It is usual to omit the third equation in solving for H ([Sutherland-63]). Then (for future reference) the set of equations becomes

$$\begin{bmatrix} \mathbf{0}^T & -w'_i \mathbf{x}'_i{}^T & y'_i \mathbf{x}'_i{}^T \\ w'_i \mathbf{x}'_i{}^T & \mathbf{0}^T & -x'_i \mathbf{x}'_i{}^T \end{bmatrix} \begin{pmatrix} \mathbf{h}^1 \\ \mathbf{h}^2 \\ \mathbf{h}^3 \end{pmatrix} = \mathbf{0}. \quad (4.3)$$

This will be written

$$A_i \mathbf{h} = \mathbf{0}$$

where A_i is now the 2×9 matrix of (4.3).

- (iii) The equations hold for any homogeneous coordinate representation $(x'_i, y'_i, w'_i)^T$ of the point \mathbf{x}'_i . One may choose $w'_i = 1$, which means that (x'_i, y'_i) are the coordinates measured in the image. Other choices are possible, however, as will be seen later.

Solving for H

Each point correspondence gives rise to two independent equations in the entries of H . Given a set of four such point correspondences, we obtain a set of equations $A\mathbf{h} = \mathbf{0}$, where A is the matrix of equation coefficients built from the matrix rows A_i contributed from each correspondence, and \mathbf{h} is the vector of unknown entries of H . We seek a non-zero solution \mathbf{h} , since the obvious solution $\mathbf{h} = \mathbf{0}$ is of no interest to us. If (4.1) is used then A has dimension 12×9 , and if (4.3) the dimension is 8×9 . In either case A has rank 8, and thus has a 1-dimensional null-space which provides a solution for \mathbf{h} . Such a solution \mathbf{h} can only be determined up to a non-zero scale factor. However, H is in general only determined up to scale, so the solution \mathbf{h} gives the required H . A scale may be arbitrarily chosen for \mathbf{h} by a requirement on its norm such as $\|\mathbf{h}\| = 1$.

4.1.2 Inhomogeneous solution

An alternative to solving for \mathbf{h} directly as a homogeneous vector is to turn the set of equations (4.3) into a inhomogeneous set of linear equations by imposing a condition $h_j = 1$ for some entry of the vector \mathbf{h} . Imposing the condition $h_j = 1$ is justified by the observation that the solution is determined only up to scale, and this scale can be chosen such that $h_j = 1$. For example, if the last element of \mathbf{h} , which corresponds to H_{33} , is chosen as unity then the resulting equations derived from (4.3) are

$$\begin{bmatrix} 0 & 0 & 0 & -x_i w'_i & -y_i w'_i & -w_i w'_i & x_i y'_i & y_i y'_i \\ x_i w'_i & y_i w'_i & w_i w'_i & 0 & 0 & 0 & -x_i x'_i & -y_i x'_i \end{bmatrix} \tilde{\mathbf{h}} = \begin{pmatrix} -w_i y'_i \\ w_i x'_i \end{pmatrix}$$

where $\tilde{\mathbf{h}}$ is an 8-vector consisting of the first 8 components of \mathbf{h} . Concatenating the equations from four correspondences then generates a matrix equation of the form
